

SECURE AND MOBILE WORKFORCE

ENABLING WORK TO HAPPEN ANYTIME, ANYWHERE

The pressure is on to enable employees, customers and partners to work anywhere, anytime. But “working from everywhere” means your confidential data is in many more places than it used to be. So, how can you ensure you’re doing everything you can to secure and protect your organization’s data?

Securing Your Data

If you’re like most organizations today, your employees are increasingly reliant on applications hosted in the cloud (IaaS/PaaS/SaaS), whether they are your company’s own applications or those provided by a third party (SaaS). Additionally, your employees are using their own mobile devices both in and out of the office (BYOD) and often times it’s difficult to know what applications are being used and by whom (shadow IT).

The challenge is, when your company must rely on the internet and other third-party infrastructure to run your organization, where do you place the firewall? Who is responsible for the security and applications running on that infrastructure? How do you manage access control? Who is generating and accessing the data, and how are they accessing it? In this new era of blurred lines and shared responsibility, it’s time to think differently about security.

Myriad360’s Approach to Security: Risk Based, Data Centric, Pervasive, Agile and Well-Engineered

At Myriad360, we recognize it’s not enough for your company to manage and secure your technology infrastructure; you must secure your mobile workforce. That’s why we continually take your organization’s business goals, increasingly complex regulations, rising user expectations, and the multitude of tools and technologies available into consideration to help create and establish a secure and mobile workforce.

Our Five-Step Approach

1

Managing your risk:

In order to manage risk you must have the ability to measure it. We can help you there. Our engineers work with you to design a security roadmap to prioritize your projects, and determine the steps needed to mitigate or manage your risks.

2

Harmonizing defense-in-depth:

To increase your company's visibility and control, we design a secure architecture that encompasses risk management, governance, and well-integrated technical controls that not only reduces risk but also leverages telemetry and automation.

3

Empowering your users:

We leverage modern identity and access management tools to help federate identity and increase the visibility of your company's user activity. By adopting these paradigms, your company will empower users to collaborate more effectively.

4

Supporting your engineers:

We work with you to simplify threat management, standardize processes and automate tasks so your engineers can focus on the work that drives your company forward.

5

Moving beyond point-in-time security:

We set up feedback loops to help you monitor and measure the effectiveness of your security program. That way, you can move beyond point-in-time security, and continue to evolve and improve your organization.
